

## **FireControl 2626**

This is the official release of FireControl 2626, which is a stand-alone application that adds support for the FireStudio [26x26] on the Mac OSX Lion operating system ONLY.

The FireStudio [26x26] is the only device that is supported in this release as it is intended to be used only with this device.

- *Daisy Chaining*: FireControl 2626 supports chaining of two FireStudio [26x26] devices. However, in order to chain other FireStudio devices with the FireStudio [26x26], Universal Control must also be installed and running alongside FireControl 2626.

Both FireControl 2626 and Universal Control can be downloaded from:

<http://www.presonus.com/technical-support/downloads/drivers-software/>

Uninstall instructions for FireControl 2626 can be found at:

<http://support.presonus.com/forums#overview>

### **Known Issues**

- If Cue Mix is enabled and then disabled in Studio One, Studio One must be Quit in order to see I/O streams return to the FireControl window.
- When two FireStudio [26x26] devices are chained, the clock source selection of the Slave device is blank, but it is correctly following the clock source and sample rate selections of the Master device.
